European foreword

- 1 The Estonian National Committee (NC) is identified by the following address

Estonian Centre for Standardisation
 Estonian National High Voltage Committee (HVC)
 Akadeemia tee 21/6, 12618 Tallinn, Estonia
 Phone: +372 605 5050
 Fax: +372 605 5070
 E-mail: info@evs.ee

- 2 The Estonian NC has prepared this Part 2-20 (EN 50341) listing the Estonian National Normative aspects, under its sole responsibility, and duly passed it through the CENELEC and CLC/TC 11 procedures.

NOTE The Estonian NC also takes sole responsibility for the technically correct co-ordination of this NNA with EN 50341-1. It has performed the necessary checks in the frame of quality assurance/control. However, it is noted that this quality control has been made in the framework of the general responsibility of a standards committee under the national laws/regulations.

- 3 This revision supersedes EVS-EN 50341-2-20:2015.

The most significant technical changes with respect to the previous edition are:

- requirements for low voltage lines are included;
- telecommunication lines located on common structures with power lines are taken into account;
- the last amendments of Estonian legal documents are taken into account.

- 4 This Part 2-20 is normative in Estonia and informative for other countries.

- 5 This Part 2-20 has to be read in conjunction with EN 50341-1, referred to hereafter as Part 1. All clause numbers used in this Part 2-20 correspond to those in Part 1. Specific subclauses, which are prefixed “EE”, are to be read as amendments to the relevant text in Part 1. Any necessary clarification regarding the application of Part 2-20 in conjunction with Part 1 shall be referred to the Estonian NC that will, in cooperation with CLC/TC 11, clarify the requirements.

When no reference is made in Part 2-20 to a specific subclause, Part 1 applies.

- 6 In the case of “box values” defined in Part 1, amended values (if any), which are defined in Part 2-20, shall be taken into account in Estonia.

However any boxed value, whether in Part 1 or in Part 2-20, shall not be amended in the direction of greater risk in the Project Specification.

Terms with prepositions “from” and “up to”, denoting boundaries of values, always include the boundary values itself, as it is common in other Estonian normative documents.

- 7 The national Estonian standards/regulations related to overhead electrical lines are listed in Clause 2.

NOTE All national standards referred to in this Part 2-20 will be replaced by the relevant European Standards as soon as they become available and are declared by the Estonian Centre for Standardisation to be applicable and thus reported to the secretary of CLC/TC 11.

0 INTRODUCTION

0.7 Language

- (snc) **EE.1 Language**
This Part 2-20 is published in English and in Estonian.

1 SCOPE

1.1 General

- (snc) **EE.1 Application to new lines**
In Estonia the standard EN 50341-1 (Part 1) can only be applied using this NNA (EN 50341-2-20) containing National Normative Aspects for Estonia.

This Part 2-20 applies to all new overhead electric lines with nominal system voltages exceeding AC 1 kV and also for low voltage (below 1 kV AC) overhead lines performed by aerial cables. The requirements of the structural design are applicable also for DC overhead lines, where the electrical requirements are given in the Project Specification.

- (ncpt) **EE.2 "New overhead line"**
A "new overhead line" means a completely new line between two points, A and B. A new branch line of the existing power line should be considered as a new power line including the junction support. Specific requirements for junction support should be defined with the Project Specification.

1.2 Field of application

- (ncpt) **EE.1 Application to covered conductors and aerial cables**
The standard includes requirements for the design and construction of overhead lines with nominal system voltages up to 45 kV AC equipped with covered conductors and aerial cables. Additionally, the requirements of the equipment standards and manufacturers' instructions shall be followed.

- (A-dev) **EE.2 Application to mounting of telecommunication equipment**
The Standard EVS EN 50341:2013 is applicable to fixing of structural elements for telecommunication (antennas, All Dielectric Self Supporting (ADSS) equipment, junction boxes, etc.), if mounted on power line supports (towers), especially regarding wind forces and ice loads on such fixed elements. The design and installation should be done under the due control of the line owner and/or the competent authority. Mounting of telecommunication equipment on power line supports must be coordinated with the line owner and stated in the Project Specification.

This standard applies to telecommunication lines only in the case of their common installation with power lines. This standard does not apply to separately installed telecommunication overhead lines.

If telecommunication equipment (antennas, dishes, etc.) will be installed in the transmission line supports, and their size, location or mounting may have major effects on the loads or design of the structures, the requirements of EVS EN 1993-3-1/NA:2009 shall also to be taken into account. If such structures include conductive parts, the requirements on clearances in subclause 5.8 should be applied.

(ncpt) **EE.3 Application to installation of other equipment**
 Only equipment belonging to the line (electric or telecommunication line) can be installed on the overhead lines. However, with the permission of the owner of the line, equipment serving communal services or environmental protection like road signs, warning signs or warning balls, etc., may also be installed. The installation height of equipment meant to be installed and maintained by an instructed person shall be such that the work can be done without climbing the support and the distances of safe electrical work can be followed. The additional loads due to this equipment on the line supports shall be taken into account if necessary.

(ncpt) **EE.4 Application to existing overhead lines**
 The Standard EVS-EN 50341:2013 shall not be applied to maintenance, branch lines, extensions or diversions of existing overhead lines in Estonia, unless specifically required in the Project Specification.

Overhead lines that meet the mechanical and electrical requirements in force at the time of their construction can be continually operated if this does not cause obvious danger. Such lines may be repaired and upgraded according to previously valid requirements. Thereat repair means replacing a damaged element with a similar new one; renovation means a more extensive improvement of the line with the aim of extending its life, while preserving the basic construction of the line.

Any modification of existing lines shall be subject to this standard, but previous norms and standards can also be used. It shall be made sure that the changes do not have a significant impact on the line's load. Modification means, for example, the relocation of some of the supports or the development of the line provided for in the initial design - for example, adding a circuit or reconductoring on existing supports.

In cases of major revisions of existing lines the degree of application of the Standard EVS-EN 50341:2013 should be in any case agreed upon by the parties concerned and specified in the Project Specification.

(ncpt) **EE.5 Application to installations under construction or design**
 Installations in the design and construction stage may be completed by using the standard valid at the beginning of planning unless otherwise agreed with the line owner and/or any other competent authority.

It must also be determined in the Project Specification which previous Standard and to what extent shall be applied to the project in question.

2 NORMATIVE REFERENCES, DEFINITIONS AND SYMBOLS

2.1 Normative references

(A-dev) **EE.1 Application of references in Part 1**
 References in EN 50341-1 apply without change.

(A-dev) **EE.2 References to Estonian national laws, regulations and standards**

Choice of lines' route and construction or mounting of high voltage overhead lines is regulated by the following Estonian laws and government regulations. These laws and regulations are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

In addition to Part 1 the following Estonian standards and acts should be taken into account:

EVS 814:2003. *Normaalbetooni külmakindlus. Määratlused, spetsifikatsioonid ja katsemeetodid.* Frost resistance of normal-weight concrete. Definitions, specifications and test method

EVS 843:2016. *Linnatänavad.* Urban streets

EVS 884:2017. *Maagaasitorustik. Projekteerimise põhinõuded üle 16 baarise tööõhuga torustikele.* Natural gas pipeline systems – Pipelines for maximum operating pressure over 16 bar – General requirements for design

EVS-EN 1991-1-4/A1:2010/NA:2010. *Eurokoodeks 1: Ehituskonstruksioonide koormused. Osa 1-4: Tuulekoormus. Eesti standardi rahvuslik lisa.* Eurocode 1: Actions on structures – Part 1-4: General actions – Wind actions. Estonian National Annex

Other valid relevant normative regulatory documents should also be taken into account.

Internal normative documents of a utility may be referred to in the Project Specification.

3 BASIS OF DESIGN

3.2 Requirements of overhead lines

3.2.2 Reliability requirements

(ncpt)

EE.1 Selection of reliability levels

Three reliability levels are used, as shown in the following table:

Table EE.3.1 — Reliability levels

Reliability level	Nominal system voltage	Line type
1	$U_n < 110 \text{ kV}$	Normal lines
	$U_n = 110 \text{ kV}$	Unimportant lines
2	$U_n = 110 \text{ kV}$	Normal lines
3	$U_n \geq 110 \text{ kV}$	Important lines, including all 330 kV lines
NOTE The type of line is considered normal unless otherwise specified in the Project Specification.		

ALTIJD DE ACTUELE NORM IN UW BEZIT HEBBEN?

Nooit meer zoeken in de systemen en uzelf de vraag stellen:
“Is NEN-EN 50341-2-20:2018 en de laatste versie?”™

Via het digitale platform NEN Connect heeft u altijd toegang tot de meest actuele versie van deze norm. Vervallen versies blijven ook beschikbaar. **U en uw collega's** kunnen de norm via NEN Connect makkelijk raadplagen, online en offline.
